## U.S. DEPARTMENT OF AGRICULTURE,

### BUREAU OF ANIMAL INDUSTRY.

A. D. MELVIN, CHIEF OF BUREAU.

## SERVICE AND REGULATORY ANNOUNCEMENTS.

AUGUST, 1915.

[This publication is issued monthly for the dissemination of information, instructions, rulings, etc., concerning the work of the Bureau of Animal Industry. Free distribution is limited to persons in the service of the bureau, establishments at which the Federal meat inspection is conducted, public officers whose duties make it desirable for them to have such information, and journals especially concerned. Others desiring copies may obtain them from the Superintendent of Documents, Government Printing Office, Washington, D. C., at 5 cents each, or 50 cents a year. A supply will be sent to each official in charge of a station or branch of the bureau service, who should promptly distribute copies to members of his force. A file should be kept at each station for reference.]

## **NOTICES REGARDING MEAT INSPECTION.**

### **CARE TO AVOID CONTAMINATION BY PUS FROM MAMMARY GLANDS.**

In order to prevent the unnecessary contamination of carcasses by pus or other objectionable material from the mammary glands and the condemnation of the parts thus contaminated, all mammary glands of cows which have lactated should be removed from the carcass without opening the milk ducts or sinuses or incising the glands or teats or any abscess which may be present. This may be accomplished in various ways. For instance, skin the gland and leave the integument on the teats, then immediately separate the gland as a whole from the carcass; or make an incision on the median line, remove the halves of the gland with the hide, and separate the halves from the hide after they have been removed from the carcass. When the latter method is fol-

lowed, special care must be exercised to avoid opening the milk sinuses or pus pockets.

If pus or other objectionable material is permitted to come in contact with the carcass the parts of the carcass thus contaminated shall be removed and condemned as contemplated by the regulations.

#### **PRECAUTIONS NECESSARY TO PREVENT CONTAMINATION OF MEAT AND PRODUCTS BY PERSPIRATION.**

Attention is directed to the possible contamination of products by the perspiration of workmen. It appears that the mixing and stuffing by hand of products such as blood wurst and blood pudding is particularly objectionable on this account, and that these operations may be accomplished by mechanical means. Inspectors engaged in meat inspection and the managements of official establishments are requested to take up this subject immediately with a view to having products prepared in a sanitary manner.

#### **METHODS TO BE FOLLOWED IN THE PREPARATION OF PORK PRODUCTS CUSTOMARILY EATEN WITHOUT COOKING.**

With reference to B. A. I. Order 211, regulation 18, section 7, paragraph 4, pork in articles of kinds prepared customarily to be eaten without cooking is considered to have been subjected to a treatment sufficient to destroy all live trichinae if the articles are prepared in accordance with certain methods, as follows:

*Sausage* containing muscle tissue of pork, if of a kind prepared customarily to be eaten without cooking, shall conform to the following requirements, or as an alternative the sausage or the muscle tissue of pork used in its preparation shall be subjected to refrigeration for not less than 20 days at a temperature not higher than 5° F.:

The sausage meat shall be ground or chopped into pieces not exceeding three-fourths inch in diameter. A dry-curing mixture containing not less than 3½ pounds of salt to each hundredweight of the unstuffed sausage shall be thoroughly mixed with the ground or chopped meat. After stuffing, the sausage shall be smoked not less than six hours at a temperature not lower than 95° F. and then dried not less than 10 days at a temperature not lower than 40° F., or if not smoked as specified it shall be dried not less than 20 days at a temperature not lower than 40° F.

*Pork hams* of kinds prepared customarily to be eaten without cooking shall conform to the following requirements, or, as an alternative, shall be subjected to refrigeration, either before or after curing, for not less than 20 days at a temperature not higher than 5° F.:

The hams shall be cured by a dry-curing process not less than 40 days, at a temperature not lower than 36° F.

Each ham before it is placed in cure shall be injected with sweet pickle containing not less than 20 per cent of salt, about 4 ounces of the solution being injected in the shank and a like quantity along the flank side of the body bone. The hams shall be laid down in salt, not less than 4 pounds to each hundredweight of hams, the salt being applied in a thorough manner to the lean meat of each ham. At least once during the curing process the hams shall be overhauled and additional salt applied, if necessary, so that the lean meat of each ham is thoroughly covered.

After removal from cure the hams may be soaked in water at a temperature not higher than 70° F. for not more than 15 hours, during which time the water may be changed once, but they shall not be subjected to any other treatment (except superficial washing) designed to remove salt from the meat.

The hams shall be smoked not less than 18 hours at a temperature not lower than 95° F., and finally dried not less than 20 days at a temperature not lower than 40° F., or if not smoked as specified, shall be dried not less than 10 days at a temperature not lower than 95° F.

Pending further investigation, all articles of kinds prepared customarily to be eaten without cooking, other than sausage and hams, shall contain no muscle tissue of pork unless the pork before, during, or after the usual processes of preparation of the products is subjected to refrigeration for not less than 20 days at a temperature not higher than 5° F.

The methods prescribed above do not apply in the case of products which contain no muscle tissue of pork except that which before, during, or after the usual processes of preparation has been subjected to heat so that all portions attain a temperature of 137° F. or higher.

#### REPORTS ON FLUKE INFESTATION.

In order to supply data on the distribution of flukes, inspectors are requested to report on F. I. Form 11-C all cases of fluke infestation in which the origin of the infested animals can be traced. If the species of fluke can be determined the name should be noted. *Fasciola hepatica* occurs in both cattle and sheep; *Fasciola magna* in cattle, rarely in sheep; and *Paragonimus kellicotti* (formerly called *P. westermanii*) in the lungs of hogs.
